1 Design and Architecture of *Chirp!*

1.1 Domain model

Here comes a description of our domain model.

Illustration of the *Chirp!* data model as UML class diagram.

Figure 1: Illustration of the *Chirp!* data model as UML class diagram.

1.2 Architecture — In the small

1.3 Architecture of deployed application

1.4 User activities

1.5 Sequence of functionality/calls trough *Chirp!*

2 Process

2.1 Build, test, release, and deployment

The following UML activity diagrams illustrate the GitHub actions workflows that are run when different criteria are met. This will be briefly described under the respective diagrams.

This workflow is run upon every push to main and pull request to main. It builds and tests to application in order to keep main void of faulty code (as **safety net**).

Build And Test Workflow

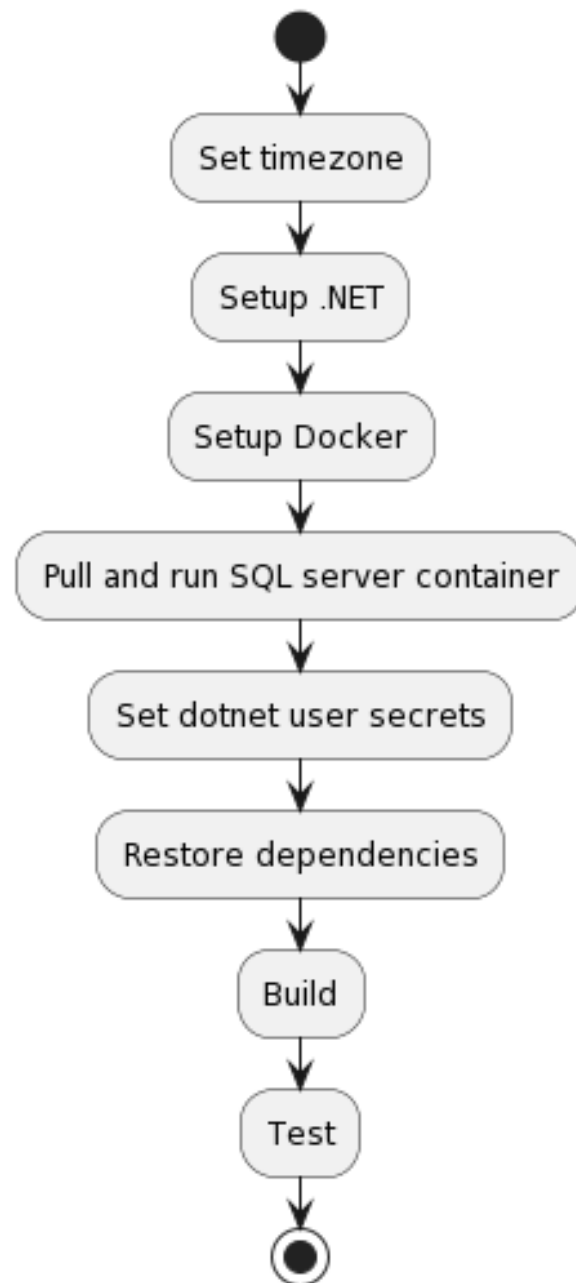

Figure 2: UML activity diagram of the build and test workflow.

Deployment Workflow

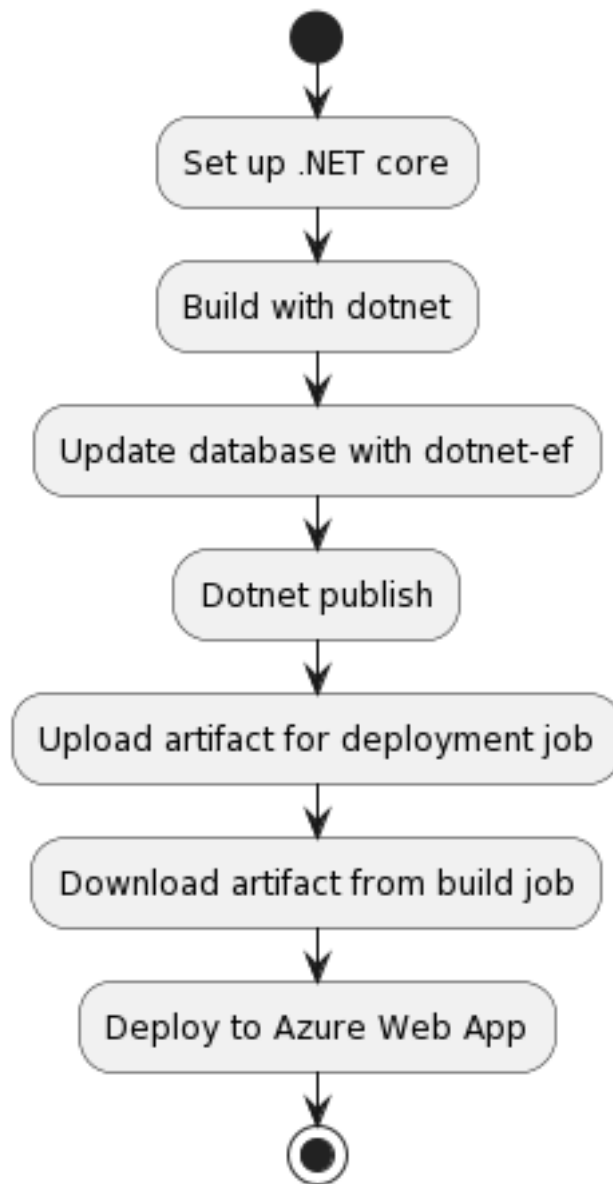

Figure 3: UML activity diagram of the deployment workflow.

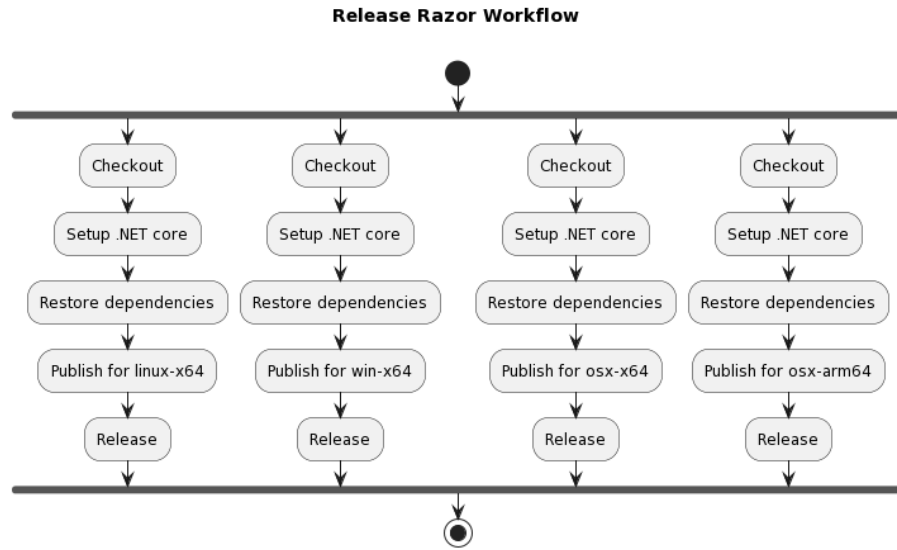

Figure 4: UML activity diagram of the release razor workflow.

2.2 Team work

2.3 How to make *Chirp!* work locally

2.4 How to run test suite locally

3 Ethics

3.1 License

3.2 LLMs, ChatGPT, CoPilot, and others
